gemstone-rs Feature Map

This map is the Rust equivalent of `gemstone-examples plan3-map` in `gemstone-py`: it ties each feature stream to the crates, examples, docs, and Python reference point that inspired it.

Run it from the CLI:

```
gemstone-rs hello
gemstone-rs compare gemstone-py
gemstone-rs compare gemstone-py --status
gemstone-rs compare gemstone-py --scorecard
gemstone-rs compare gemstone-py --parity
gemstone-rs compare gemstone-py --gaps
gemstone-rs compare gemstone-py --next
gemstone-rs compare gemstone-py --totals
gemstone-rs compare gemstone-py --batches
gemstone-rs compare all --status
gemstone-rs compare all --scorecard
gemstone-rs compare all --parity
gemstone-rs compare all --next
gemstone-rs compare all --totals
gemstone-rs compare all --batches
gemstone-rs examples map
gemstone-rs examples map --json
gemstone-rs examples scaffold quickstart ./gemstone-rs-quickstart
gemstone-rs examples scaffold codegen_workflow ./gemstone-rs-codegen-workflow
gemstone-rs examples scaffold profile_codegen_workflow ./gemstone-rs-profile-codegen
gemstone-rs examples scaffold generated_wrapper_app ./gemstone-rs-generated-wrapper
gemstone-rs examples scaffold session_worker_pool ./gemstone-rs-worker-pool
gemstone-rs examples scaffold axum_service ./gemstone-rs-axum-service
gemstone-rs examples scaffold actix_service ./gemstone-rs-actix-service
```

`hello` is the no-live sanity check that mirrors `gemstone-examples hello`. `compare gemstone-py` prints a compact version of the Python/Rust comparison guide. `compare gemstone-js` remains available as archived background reference, but active planning now focuses on `gemstone-rs`. The `--status` forms give the shortest answer with the direct recommendation, parity score, remaining batch count, next batch, top gap, and follow-up commands. The `--scorecard` forms print the shortest decision view: when to use each project, current strengths, the remaining batch count, the next batch, and the top gap. The `--parity` forms print area-by-area maturity scores for API, web, async, codegen, explorer, release, and native-core work. The `--gaps` forms print remaining parity gaps with next actions and verification commands. The `--next` forms print the first recommended batch and top priority gap. The `--totals` forms print only the batch/hour totals for planning and CI. The `--batches` forms answer how much work remains, including batch counts, hour ranges, outcomes, and verification commands. Use `compare all` with the same flags to print the active `gemstone-rs` track; `compare all --batches` reports **1 batch** and roughly **6-10 hours**. `examples scaffold` creates standalone Cargo projects from installed

templates for quickstart, browser, BridgeRoot mapping, derive mapping, generated wrappers, live discovery, profile-driven codegen, standard HTTP, worker-pool, Axum, and Actix workflows. JSON output is intended for CI, docs checks, and editor tooling. Compare reports are covered by `schemas/gemstone-rs.compare.schema.json`, so release scripts and editor panels can validate the same summary, status, scorecard, parity, gap, next-action, totals, and batch-plan shapes that the CLI prints.

What This Says Compared With `gemstone-py`

`gemstone-rs` is strongest where Rust is naturally valuable: direct native GemStone access, explicit OOP/value handling, typed generated wrappers, BridgeRoot mapping, and CLI/explorer tooling that can run without Python in the process.

`gemstone-py` remains stronger where Python already has mature product shape: broader web framework adapters, async examples, the database explorer, package extras, and broader release surfaces.

The projects should converge by sharing the Rust native core underneath `gemstone-py-native`, while keeping the Python and Rust APIs idiomatic for their respective users.

This PDF was generated locally from `docs/`. If you edit the Markdown sources, rerun `python docs/build_pdf_docs.py`.
